

# **QGIS Server 3.22 User Guide**

**QGIS Project**

**2023 年 02 月 02 日**

# 目次

# 第 1 章

## はじめに

QGIS Server is an open source WMS, WFS, OGC API for Features 1.0 (WFS3) and WCS implementation that, in addition, implements advanced cartographic features for thematic mapping. QGIS Server is a FastCGI/CGI (Common Gateway Interface) application written in C++ that works together with a web server (e.g., Apache, Nginx). It has Python plugin support allowing for fast and efficient development and deployment of new features.

QGIS サーバーは、GIS ロジックのためのバックエンドとして、地図のレンダリングに QGIS を使用しています。また、Qt ライブラリは、グラフィックスおよびプラットフォームに依存しない C++ プログラミングのために使用されます。他の WMS のソフトウェアとは対照的に、QGIS サーバーは、サーバーの構成およびユーザー定義の地図作成ルールの間、設定言語として地図作成規則を使用します。

QGIS のデスクトップと QGIS サーバーは同じ可視化ライブラリを使用するように、ウェブ上で公開されている地図は、デスクトップ GIS と同じに見えます。

次のセクションでは、Linux (Debian、Ubuntu および派生物) と Windows に QGIS サーバをセットアップするためのサンプル構成を提供します。サーバプラグイン開発の詳細は `server_plugins` を参照。

## 第 2 章

# はじめに

### 2.1 Debian のベースのシステムへのインストール

We will give a short and simple installation how-to for a minimal working configuration on Debian based systems (including Ubuntu and derivatives). However, many other distributions and OSs provide packages for QGIS Server.

---

注釈: In Ubuntu you can use your regular user, prepending `sudo` to commands requiring admin permissions. In Debian you can work as admin (`root`), without using `sudo`.

---

Requirements and steps to add official QGIS repositories to install QGIS Server on a Debian based system are provided in [QGIS installers page](#). You may want to install at least the latest Long Term Release.

Once the target version repository is configured and QGIS Server installed, you can test the installation with:

```
/usr/lib/cgi-bin/qgis_mapserv.fcgi
```

If you get the following output, the server is correctly installed.

---

注釈: Depending on the version of QGIS, you might see slightly different output reported when you run `qgis_mapserv.fcgi`.

---

```
QFSFileEngine::open: No file name specified
Warning 1: Unable to find driver ECW to unload from GDAL_SKIP environment variable.
Warning 1: Unable to find driver ECW to unload from GDAL_SKIP environment variable.
Warning 1: Unable to find driver JP2ECW to unload from GDAL_SKIP environment variable.
Warning 1: Unable to find driver ECW to unload from GDAL_SKIP environment variable.
Warning 1: Unable to find driver JP2ECW to unload from GDAL_SKIP environment variable.
Content-Length: 206
Content-Type: text/xml; charset=utf-8
```

(次のページに続く)

```
<ServiceExceptionReport version="1.3.0" xmlns="https://www.opengis.net/ogc">
  <ServiceException code="Service configuration error">Service unknown or unsupported</
  ↳ServiceException>
</ServiceExceptionReport>
```

注釈: As seen below, QGIS reports a Status 400 code, which correctly identifies the request has failed because there is no active http session. This is not a bug and indicates the server is functioning properly.

```

QFSFileEngine::open: No file name specified
Content-Length: 102
Content-Type: application/json
Server: QGIS FCGI server - QGIS version 3.22.6-Bia^c5^82owie^c5^bca
Status: 400
[{"code":"Bad request error","description":"Requested URI does not match any
↳registered API handler"}]
```

Let's add a sample project. You can use your own, or one from [Training demo data](#):

```
mkdir /home/qgis/projects/
cd /home/qgis/projects/
wget https://github.com/qgis/QGIS-Training-Data/archive/release_3.22.zip
unzip release_3.22.zip
mv QGIS-Training-Data-release_3.22/exercise_data/qgis-server-tutorial-data/world.qgs .
mv QGIS-Training-Data-release_3.22/exercise_data/qgis-server-tutorial-data/
↳naturalearth.sqlite .
```

Of course, you can use your favorite GIS software to open this file and take a look at the configuration and available layers.

To properly deploy QGIS server you need a HTTP server. Recommended choices are [Apache](#) or [NGINX](#).

## 2.1.1 Apache HTTP Server

注釈: In the following, please replace `qgis.demo` with the name or IP address of your server.

1. Install Apache and `mod_fcgid`:

```
apt install apache2 libapache2-mod-fcgid
```

2. You can run QGIS Server on your default website, but let's configure a `virtualhost` specifically for this, as follows.

1. In the `/etc/apache2/sites-available` directory, create a file called `qgis.demo.conf`, with this content:

```
<VirtualHost *:80>
    ServerAdmin webmaster@localhost
    ServerName qgis.demo

    DocumentRoot /var/www/html

    # Apache logs (different than QGIS Server log)
    ErrorLog ${APACHE_LOG_DIR}/qgis.demo.error.log
    CustomLog ${APACHE_LOG_DIR}/qgis.demo.access.log combined

    # Longer timeout for WPS... default = 40
    FcgidIOTimeout 120

    FcgidInitialEnv LC_ALL "en_US.UTF-8"
    FcgidInitialEnv PYTHONIOENCODING UTF-8
    FcgidInitialEnv LANG "en_US.UTF-8"

    # QGIS log
    FcgidInitialEnv QGIS_SERVER_LOG_STDERR 1
    FcgidInitialEnv QGIS_SERVER_LOG_LEVEL 0

    # default QGIS project
    SetEnv QGIS_PROJECT_FILE /home/qgis/projects/world.qgs

    # QGIS_AUTH_DB_DIR_PATH must lead to a directory writeable by the Server's
    ↪FCGI process user
    FcgidInitialEnv QGIS_AUTH_DB_DIR_PATH "/home/qgis/qgisserverdb/"
    FcgidInitialEnv QGIS_AUTH_PASSWORD_FILE "/home/qgis/qgisserverdb/qgis-auth.
    ↪db"
```

(次のページに続く)

```

# Set pg access via pg_service file
SetEnv PGSERVICEFILE /home/qgis/.pg_service.conf
FcgidInitialEnv PGPASSFILE "/home/qgis/.pgpass"

# if qgis-server is installed from packages in debian based distros this
↳is usually /usr/lib/cgi-bin/
# run "locate qgis_mapserv.fcgi" if you don't know where qgis_mapserv.fcgi
↳is
ScriptAlias /cgi-bin/ /usr/lib/cgi-bin/
<Directory "/usr/lib/cgi-bin/">
    AllowOverride None
    Options +ExecCGI -MultiViews -SymLinksIfOwnerMatch
    Require all granted
</Directory>

<IfModule mod_fcgid.c>
    FcgidMaxRequestLen 26214400
    FcgidConnectTimeout 60
</IfModule>

</VirtualHost>

```

注釈: Some of the above configuration options are explained in the Server *environment variables* and *pg\_service* file sections.

- Let's now create the directories that will store the QGIS Server logs and the authentication database:

```

mkdir -p /var/log/qgis/
chown www-data:www-data /var/log/qgis
mkdir -p /home/qgis/qgisserverdb
chown www-data:www-data /home/qgis/qgisserverdb

```

注釈: `www-data` is the Apache user on Debian based systems and we need Apache to have access to those locations or files. The `chown www-data...` commands change the owner of the respective directories and files to `www-data`.

- We can now enable the virtual host and the `fcgid` mod if it's not already done:

```
a2enmod fcgid
a2ensite qgis.demo
```

4. Now restart Apache for the new configuration to be taken into account:

```
systemctl restart apache2
```

5. Now that Apache knows that he should answer requests to <http://qgis.demo> we also need to setup the client system so that it knows who `qgis.demo` is. We do that by adding `127.0.0.1 qgis.demo` in the `hosts` file.

```
# Replace 127.0.0.1 with the IP of your server.
sh -c "echo '127.0.0.1 qgis.demo' >> /etc/hosts"``.
```

**重要:** Remember that both the `qgis.demo.conf` and `/etc/hosts` files should be configured for your setup to work. You can also test the access to your QGIS Server from other clients on the network (e.g. Windows or macos machines) by going to their `/etc/hosts` file and point the `qgis.demo` name to whatever IP the server machine has on the network (not `127.0.0.1` as it is the local IP, only accessible from the local machine). On `*nix` machines the `hosts` file is located in `/etc`, while on Windows it's under the `C:\Windows\System32\drivers\etc` directory. Under Windows you need to start your text editor with administrator privileges before opening the `hosts` file.

QGIS Server is now available at <http://qgis.demo>. To check, type in a browser, as in the simple case:

```
http://qgis.demo/cgi-bin/qgis_mapserv.fcgi?SERVICE=WMS&VERSION=1.3.0&
↳REQUEST=GetCapabilities
```

## 2.1.2 NGINX HTTP Server

**注釈:** In the following, please replace `qgis.demo` with the name or IP address of your server.

You can also use QGIS Server with `NGINX`. Unlike Apache, `NGINX` does not automatically spawn FastCGI processes. The FastCGI processes are to be started by something else.

Install `NGINX`:

```
apt install nginx
```

- As a first option, you can use **spawn-fcgi** or **fcgiwrap** to start and manage the QGIS Server processes. Official Debian packages exist for both. When you have no X server running and you need, for example, printing, you can use `xvfb`.
- Another option is to rely on **Systemd**, the init system for GNU/Linux that most Linux distributions use

today. One of the advantages of this method is that it requires no other components or processes. It's meant to be simple, yet robust and efficient for production deployments.

### NGINX Configuration

The `include fastcgi_params;` used in the previous configuration is important, as it adds the parameters from `/etc/nginx/fastcgi_params`:

```
fastcgi_param QUERY_STRING      $query_string;
fastcgi_param REQUEST_METHOD    $request_method;
fastcgi_param CONTENT_TYPE      $content_type;
fastcgi_param CONTENT_LENGTH    $content_length;

fastcgi_param SCRIPT_NAME       $fastcgi_script_name;
fastcgi_param REQUEST_URI       $request_uri;
fastcgi_param DOCUMENT_URI      $document_uri;
fastcgi_param DOCUMENT_ROOT     $document_root;
fastcgi_param SERVER_PROTOCOL   $server_protocol;
fastcgi_param REQUEST_SCHEME    $scheme;
fastcgi_param HTTPS             $https if_not_empty;

fastcgi_param GATEWAY_INTERFACE CGI/1.1;
fastcgi_param SERVER_SOFTWARE   nginx/$nginx_version;

fastcgi_param REMOTE_ADDR       $remote_addr;
fastcgi_param REMOTE_PORT       $remote_port;
fastcgi_param SERVER_ADDR       $server_addr;
fastcgi_param SERVER_PORT       $server_port;
fastcgi_param SERVER_NAME       $server_name;

# PHP only, required if PHP was built with --enable-force-cgi-redirect
fastcgi_param REDIRECT_STATUS   200;
```

Moreover, you can use some 環境変数 to configure QGIS Server. In the NGINX configuration file, `/etc/nginx/nginx.conf`, you have to use `fastcgi_param` instruction to define these variables as shown below:

```
location /qgisserver {
    gzip            off;
    include         fastcgi_params;
    fastcgi_param   QGIS_SERVER_LOG_STDERR 1;
    fastcgi_param   QGIS_SERVER_LOG_LEVEL  0;
    fastcgi_pass    unix:/var/run/qgisserver.socket;
}
```

## FastCGI wrappers

**警告:** `fcgiwrap` is easier to set up than `spawn-fcgi`, because it's already wrapped in a Systemd service. But it also leads to a solution that is much slower than using `spawn-fcgi`. With `fcgiwrap`, a new QGIS Server process is created on each request, meaning that the QGIS Server initialization process, which includes reading and parsing the QGIS project file, is done on each request. With `spawn-fcgi`, the QGIS Server process remains alive between requests, resulting in much better performance. For that reason, `spawn-fcgi` is recommended for production use.

### spawn-fcgi

If you want to use `spawn-fcgi`:

1. The first step is to install the package:

```
apt install spawn-fcgi
```

2. Then, introduce the following block in your NGINX server configuration:

```
location /qgisserver {
    gzip            off;
    include         fastcgi_params;
    fastcgi_pass    unix:/var/run/qgisserver.socket;
}
```

3. And restart NGINX to take into account the new configuration:

```
systemctl restart nginx
```

4. Finally, considering that there is no default service file for `spawn-fcgi`, you have to manually start QGIS Server in your terminal:

```
spawn-fcgi -s /var/run/qgisserver.socket \
           -U www-data -G www-data -n \
           /usr/lib/cgi-bin/qgis_mapserv.fcgi
```

QGIS Server is now available at <http://qgis.demo/qgisserver>.

**注釈:** When using `spawn-fcgi`, you may directly define environment variables before running the server. For example: `export QGIS_SERVER_LOG_STDERR=1`

Of course, you can add an init script to start QGIS Server at boot time or whenever you want. For example with `systemd`:

1. Edit the file `/etc/systemd/system/qgis-server.service` with this content:

```
[Unit]
Description=QGIS server
After=network.target

[Service]
;; set env var as needed
;Environment="LANG=en_EN.UTF-8"
;Environment="QGIS_SERVER_PARALLEL_RENDERING=1"
;Environment="QGIS_SERVER_MAX_THREADS=12"
;Environment="QGIS_SERVER_LOG_LEVEL=0"
;Environment="QGIS_SERVER_LOG_STDERR=1"
;; or use a file:
;EnvironmentFile=/etc/qgis-server/env

ExecStart=spawn-fcgi -s /var/run/qgisserver.socket -U www-data -G www-data -n /
↳usr/lib/cgi-bin/qgis_mapserv.fcgi

[Install]
WantedBy=multi-user.target
```

2. Then enable and start the service:

```
systemctl enable --now qgis-server
```

**警告:** With the above commands `spawn-fcgi` spawns only one QGIS Server process.

### fcgiwrap

Using `fcgiwrap` is much easier to setup than `spawn-fcgi` but it's much slower.

1. You first have to install the corresponding package:

```
apt install fcgiwrap
```

2. Then, introduce the following block in your NGINX server configuration:

```
1 location /qgisserver {
2     gzip            off;
3     include         fastcgi_params;
4     fastcgi_pass    unix:/var/run/fcgiwrap.socket;
```

(次のページに続く)

(前のページからの続き)

```

5     fastcgi_param SCRIPT_FILENAME /usr/lib/cgi-bin/qgis_mapserv.fcgi;
6 }

```

3. Finally, restart NGINX and **fcgiwrap** to take into account the new configuration:

```

systemctl restart nginx
systemctl restart fcgiwrap

```

QGIS Server is now available at <http://qgis.demo.qgisserver>.

## Systemd

QGIS Server needs a running X Server to be fully usable, in particular for printing. In the case you already have a running X Server, you can use systemd services.

This method, to deploy QGIS Server, relies on two Systemd units to configure: a **Socket unit** and a **Service unit**.

1. The **QGIS Server Socket unit** defines and creates a file system socket, used by NGINX to start and communicate with QGIS Server. The Socket unit has to be configured with `Accept=false`, meaning that the calls to the `accept()` system call are delegated to the process created by the Service unit. It is located in `/etc/systemd/system/qgis-server@.socket`, which is actually a template:

```

[Unit]
Description=QGIS Server Listen Socket (instance %i)

[Socket]
Accept=false
ListenStream=/var/run/qgis-server-%i.sock
SocketUser=www-data
SocketGroup=www-data
SocketMode=0600

[Install]
WantedBy=sockets.target

```

2. Now enable and start sockets:

```

for i in 1 2 3 4; do systemctl enable --now qgis-server@$i.socket; done

```

3. The **QGIS Server Service unit** defines and starts the QGIS Server process. The important part is that the Service process ' standard input is connected to the socket defined by the Socket unit. This has to be configured using `StandardInput=socket` in the Service unit configuration located in `/etc/systemd/system/qgis-server@.service`:

```
[Unit]
Description=QGIS Server Service (instance %i)

[Service]
User=www-data
Group=www-data
StandardOutput=null
StandardError=journal
StandardInput=socket
ExecStart=/usr/lib/cgi-bin/qgis_mapserv.fcgi
EnvironmentFile=/etc/qgis-server/env

[Install]
WantedBy=multi-user.target
```

---

注釈: The QGIS Server *environment variables* are defined in a separate file, `/etc/qgis-server/env`. It could look like this:

```
QGIS_PROJECT_FILE=/etc/qgis/myproject.qgs
QGIS_SERVER_LOG_STDERR=1
QGIS_SERVER_LOG_LEVEL=3
```

---

4. Now start socket service:

```
for i in 1 2 3 4; do systemctl enable --now qgis-server@$i.service; done
```

5. Finally, for the NGINX HTTP server, let's introduce the configuration for this setup:

```
upstream qgis-server_backend {
    server unix:/var/run/qgis-server-1.sock;
    server unix:/var/run/qgis-server-2.sock;
    server unix:/var/run/qgis-server-3.sock;
    server unix:/var/run/qgis-server-4.sock;
}

server {
    ...

    location /qgis-server {
        gzip off;
        include fastcgi_params;
```

(次のページに続く)

(前のページからの続き)

```
    fastcgi_pass qgis-server_backend;
  }
}
```

6. Now restart NGINX for the new configuration to be taken into account:

```
systemctl restart nginx
```

Thanks to Oslandia for sharing [their tutorial](#).

### 2.1.3 Xvfb

QGIS Server needs a running X Server to be fully usable, in particular for printing. On servers it is usually recommended not to install it, so you may use xvfb to have a virtual X environment.

If you're running the Server in graphic/X11 environment then there is no need to install xvfb. More info at <https://www.itopen.it/qgis-server-setup-notes/>.

1. To install the package:

```
apt install xvfb
```

2. Create the service file, `/etc/systemd/system/xvfb.service`, with this content:

```
[Unit]
Description=X Virtual Frame Buffer Service
After=network.target

[Service]
ExecStart=/usr/bin/Xvfb :99 -screen 0 1024x768x24 -ac +extension GLX +render -
↳noreset

[Install]
WantedBy=multi-user.target
```

3. `xvfb.service` の状態を有効にし、開始し、チェックします :

```
systemctl enable --now xvfb.service
systemctl status xvfb.service
```

4. Then, according to your HTTP server, you should configure the **DISPLAY** parameter or directly use **xvfb-run**.

- Using Apache:

1. Add to your *Fcgid* configuration (see *Apache HTTP Server*):

```
FcgidInitialEnv DISPLAY ":99"
```

2. Restart Apache for the new configuration to be taken into account:

```
systemctl restart apache2
```

- Using NGINX

- With spawn-fcgi using *xvfb-run*:

```
xvfb-run /usr/bin/spawn-fcgi -f /usr/lib/cgi-bin/qgis_mapserv.fcgi \  
-s /tmp/qgisserver.socket \  
-G www-data -U www-data -n
```

- With the **DISPLAY** environment variable in the HTTP server configuration.

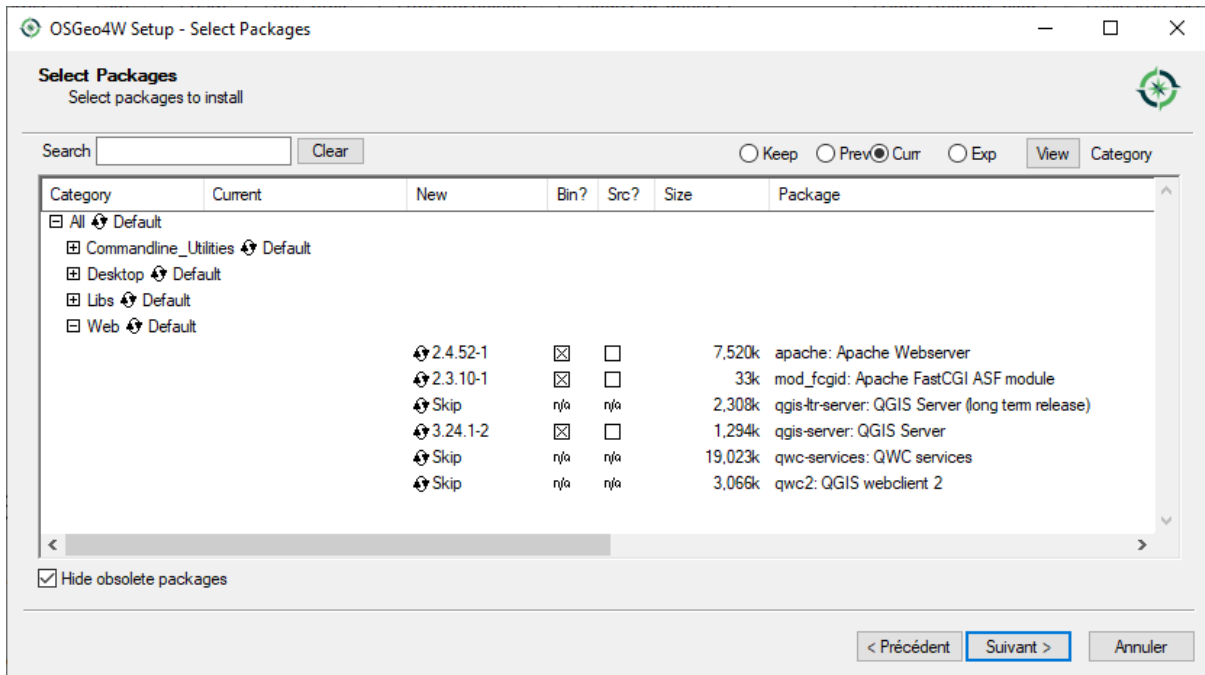

```
fastcgi_param DISPLAY ":99";
```

## 2.2 Installation on Windows

QGIS Server can also be installed on Windows systems using the 64 bit version of the OSGeo4W network installer (<https://qgis.org/en/site/forusers/download.html>).

A simple procedure is the following:

1. Download and run the OSGeo4W installer
2. Follow the "Advanced Install" and install the **QGIS Desktop**, **QGIS Server apache** and **mod\_fcgid** packages.

3. Apache is not directly installed as a service on Windows. You need to:

1. Right-click the OSGeo4W.bat file at the root of the C:\OSGeo4W64\ folder (if the default installation paths have been used) and select *Run as administrator*
2. In the console, run `apache-install.bat`, which will output

```
> apache-install.bat
Installing the 'Apache OSGeo4W Web Server' service
The 'Apache OSGeo4W Web Server' service is successfully installed.
Testing httpd.conf....
Errors reported here must be corrected before the service can be started.
...
```

The service is started as you can notice in the report. But the server may fail to run due to missing custom configuration.

4. Edit the C:\OSGeo4w64\apps\apache\conf\httpd.conf file with the following changes (various other combinations are possible):

Purpose	Existing config	Replacement
(Optional) Customize the address to listen to using an IP and/or port, You can and add as many entries as you wish.	<code>Listen \${SRVPORT}</code>	<code>Listen localhost:8080</code>
Indicate where to find the script files	<code>ScriptAlias /cgi-bin/ "\$ ↳{SRVROOT}/cgi-bin/"</code>	<code>ScriptAlias /cgi-bin/ ↳"C:/OSGeo4W64/apps/ ↳qgis/bin/"</code>
Provide permissions on the script folder	<code>&lt;Directory "\${SRVROOT}/ ↳cgi-bin"&gt;     AllowOverride None     Options None     Require all granted &lt;/Directory&gt;</code>	<code>&lt;Directory "C:/ ↳OSGeo4W64/apps/qgis/ ↳bin"&gt;     SetHandler cgi- ↳script     AllowOverride None     Options ExecCGI     Require all granted &lt;/Directory&gt;</code>
Enable file extensions to use for script files. Uncomment and complete	<code>#AddHandler cgi-script . ↳cgi</code>	<code>AddHandler cgi-script . ↳cgi .exe</code>
Add more OSGeo4W custom configuration variables	<code># parse OSGeo4W apache_ ↳conf files IncludeOptional "C:/ ↳OSGeo4W64/httpd.d/ ↳httpd_*.conf"</code>	<code># parse OSGeo4W apache_ ↳conf files IncludeOptional "C:/ ↳OSGeo4W64/httpd.d/ ↳httpd_*.conf" SetEnv GDAL_DATA "C:/ ↳OSGeo4W64/share/gdal" SetEnv QGIS_AUTH_DB_DIR_ ↳PATH "C:/OSGeo4W64/ ↳apps/qgis/resources"</code>

5. Restart the Apache web server

```
> apache-restart.bat
```

6. Open browser window to testing a GetCapabilities request to QGIS Server. Replace localhost:8080 with the IP and port you set to listen.

```
http://localhost:8080/cgi-bin/qgis_mapserv.fcgi.exe?SERVICE=WMS&VERSION=1.3.0&
REQUEST=GetCapabilities
```

A XML file with the capabilities should be returned. Your server is ready to use.

## 2.3 Serve a project

Now that QGIS Server is installed and running, we just have to use it.

Obviously, we need a QGIS project to work on. Of course, you can fully customize your project by defining contact information, precise some restrictions on CRS or even exclude some layers. Everything you need to know about that is described later in *Configure your project*.

But for now, we are going to use a simple project already configured and previously downloaded in `/home/qgis/projects/world.qgs`, as described above.

By opening the project and taking a quick look on layers, we know that 4 layers are currently available:

- airports
- places
- countries
- countries\_shapeburst

You don't have to understand the full request for now but you may retrieve a map with some of the previous layers thanks to QGIS Server by doing something like this in your web browser to retrieve the *countries* layer:

```
http://qgis.demo/qgisserver?
MAP=/home/qgis/projects/world.qgs&
LAYERS=countries&
SERVICE=WMS&
VERSION=1.3.0&
REQUEST=GetMap&
CRS=EPSG:4326&
WIDTH=400&
HEIGHT=200&
BBOX=-90,-180,90,180
```

If you obtain the next image, then QGIS Server is running correctly:

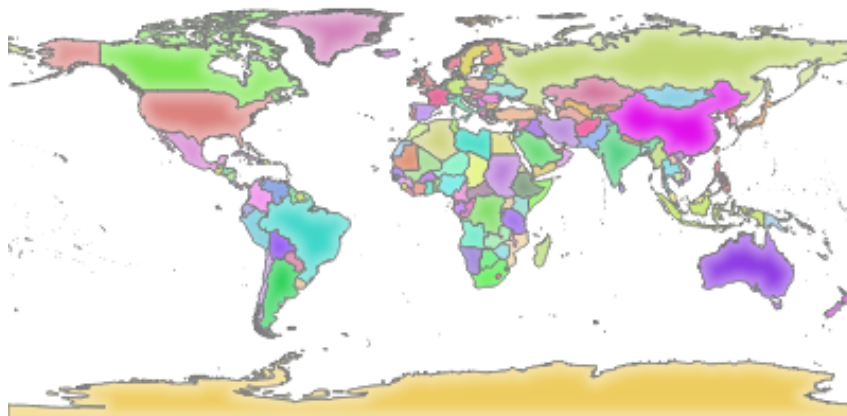

図 2.1 Server response to a basic GetMap request

Note that you may define **QGIS\_PROJECT\_FILE** environment variable to use a project by default instead of giving a **MAP** parameter (see 環境変数).

For example with spawn-fcgi:

```
export QGIS_PROJECT_FILE=/home/qgis/projects/world.qgs
spawn-fcgi -f /usr/lib/bin/cgi-bin/qgis_mapserv.fcgi \
-s /var/run/qgisserver.socket \
-U www-data -G www-data -n
```

## 2.4 Configure your project

To provide a new QGIS Server WMS, WFS or WCS, you have to create a QGIS project file with some data or use one of your current project. Define the colors and styles of the layers in QGIS and the project CRS, if not already defined.
